

ES-Gripper Setup Manual in URCap Software

(Installation instructions for Universal Robot e Series)

About this manual

This manual contains information on the "URCap" software. The software is used to easily integrate and control the following products in Universal Robots applications:

- **ES-Gripper for cobot**

Illustrations in this manual are provided for basic understanding and may differ from the actual product design.

This manual describes the software environment on an e-Series UR robot. Follow the instructions for the robot.

Applicable documents

- Assembly and operating manual for the product

Functional description of "URCap"

The "URCap" software is used for the simple commissioning and programming of the ES-Gripper in combination with robots from Universal Robots. The "URCap" software is integrated seamlessly into the "Polyscope" programming environment of Universal Robots. The programming and configuration of the gripper are supported via the control panel of the robot.

The "URCap" software has been tested under the Polyscope version 5.11.0 of Universal Robots. I-PEX recommends installing the current Polyscope version on the robot used. To avoid compatibility problems, check the operating software of the UR device before using the "URCap" software and update it if necessary.

The "URCap" software was tested at I-PEX with the following

system configuration:

- Starter Package for SDK 1.13.0
- URCAP SDK 1.13.0
- Polyscope version 5.11.0

ES-Gripper feature1 (Sensor)

ES-TORQ

Electrostatic Capacitance Torque Sensor

- Simple construction, light weight & high durability due to adoption of electrostatic capacitance system
- Built-in micro computer, outer module for corrective process is not required
- Can be used without initial setup

Interface
USB
RS422
RS485

ES-TORQ spec.

仕様 Spec

項目/Items	仕様/Spec
電源電圧/Power supply	DC5V
定格荷重/Measurable force	5Nm ※1
出力形態/Output form	RS422
消費電流/Current consumption	120mA max.
使用温度範囲/Operating temp.limit	0 to 80 °C (Non-condensing)
ボーレート/Baud rate	307.2kbps ※2
サンプリング周波数/Frequency response	5KHz ※2
外形寸法/External dimensions	Standard type : Φ80mm×H96.4mm / Vertical type ; Φ80mm×H94mm
質量/Weight	415g (Except for Attachment)
標準ケーブル長/Standard length of cable	2.0m

※1 測定可能な荷重(N)範囲は、Body Type、Attachment形状によって値が変わります。

※2 ボーレートを115.2kbps、サンプリング周期を1 kHzに変更可能です。

※1 The measurable load (N) range changes depending on the Body Type and Attachment shape.

※2 The baud rate and sampling period is changeable. Please kindly refer to the data as below.

Baud rate: 307.2 kbps → 115.2 kbps

Frequency response 5 kHz → 1 kHz

ES-Gripper Feature2 (Body)

Built-in floating mechanism can be adapted to the offset problems caused by the jig/product positioning/robotic...etc. during product assembly on the production line

ES-Gripper(Standard type)

ES-Gripper(Omnidirectional type)

Connection assembly application (Floating function for Pick up FPC)

Connection assembly application (Floating function for misalignment of pitch and θ direction)

ES-Gripper automatic correction movement

	Correction direction
STANDARD TYPE	X, θ
VERTICAL TYPE	X, θ
OMNIDIRECTIONAL TYPE	X, Y, θ
FINE CONTROL DEVICE ASS'Y	X, θ or X, Y, θ

Technical notes

The position misalignment automatic correction function does not work beyond the allowable range of the design of the connector itself.

Originally, it is a function that ES-Gripper has realized the movement that humans naturally support by hand.

Please contact us for the allowable design range of each connector.

Interface

Pneumatic
connector

Installation

1. Place the flange on the tip of the robot and lock it tightly
(refer robot manual , the M6 tightening torque is 8Nm)
Due to different robot suppliers, please refer to the manual of each robot for its screw tightening torque

2. Place the ES-Gripper body on the flange and tighten it (the tightening torque of the M4 screw 1.8T series is 2.70 Nm)

3. Place the Attachment on the ES-Gripper body and tighten it (M3 screw locking force 1.8T series is 1.14 Nm)

USB / RS422 / RS485 Connect the corresponding interface of the robot control unit

(Use $\Phi 4$ air hoses connection to vacuum control valve here)

ES-Gripper Installation

Vacuum generator

From Air compressor

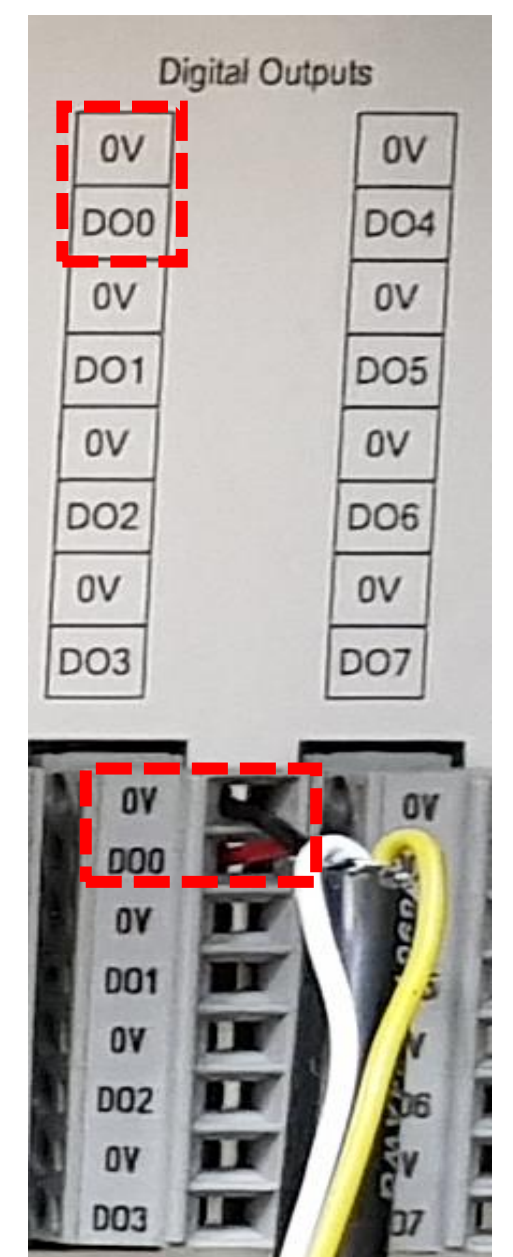

URCap setting for Vacuum generator control

Configuring digital output for the solenoid valve output setting (for Vacuum generator control)

Control of the solenoid value output is only possible via the separate digital supply lines. If the solenoid value output is deactivated, the digital outputs are not used in the program.

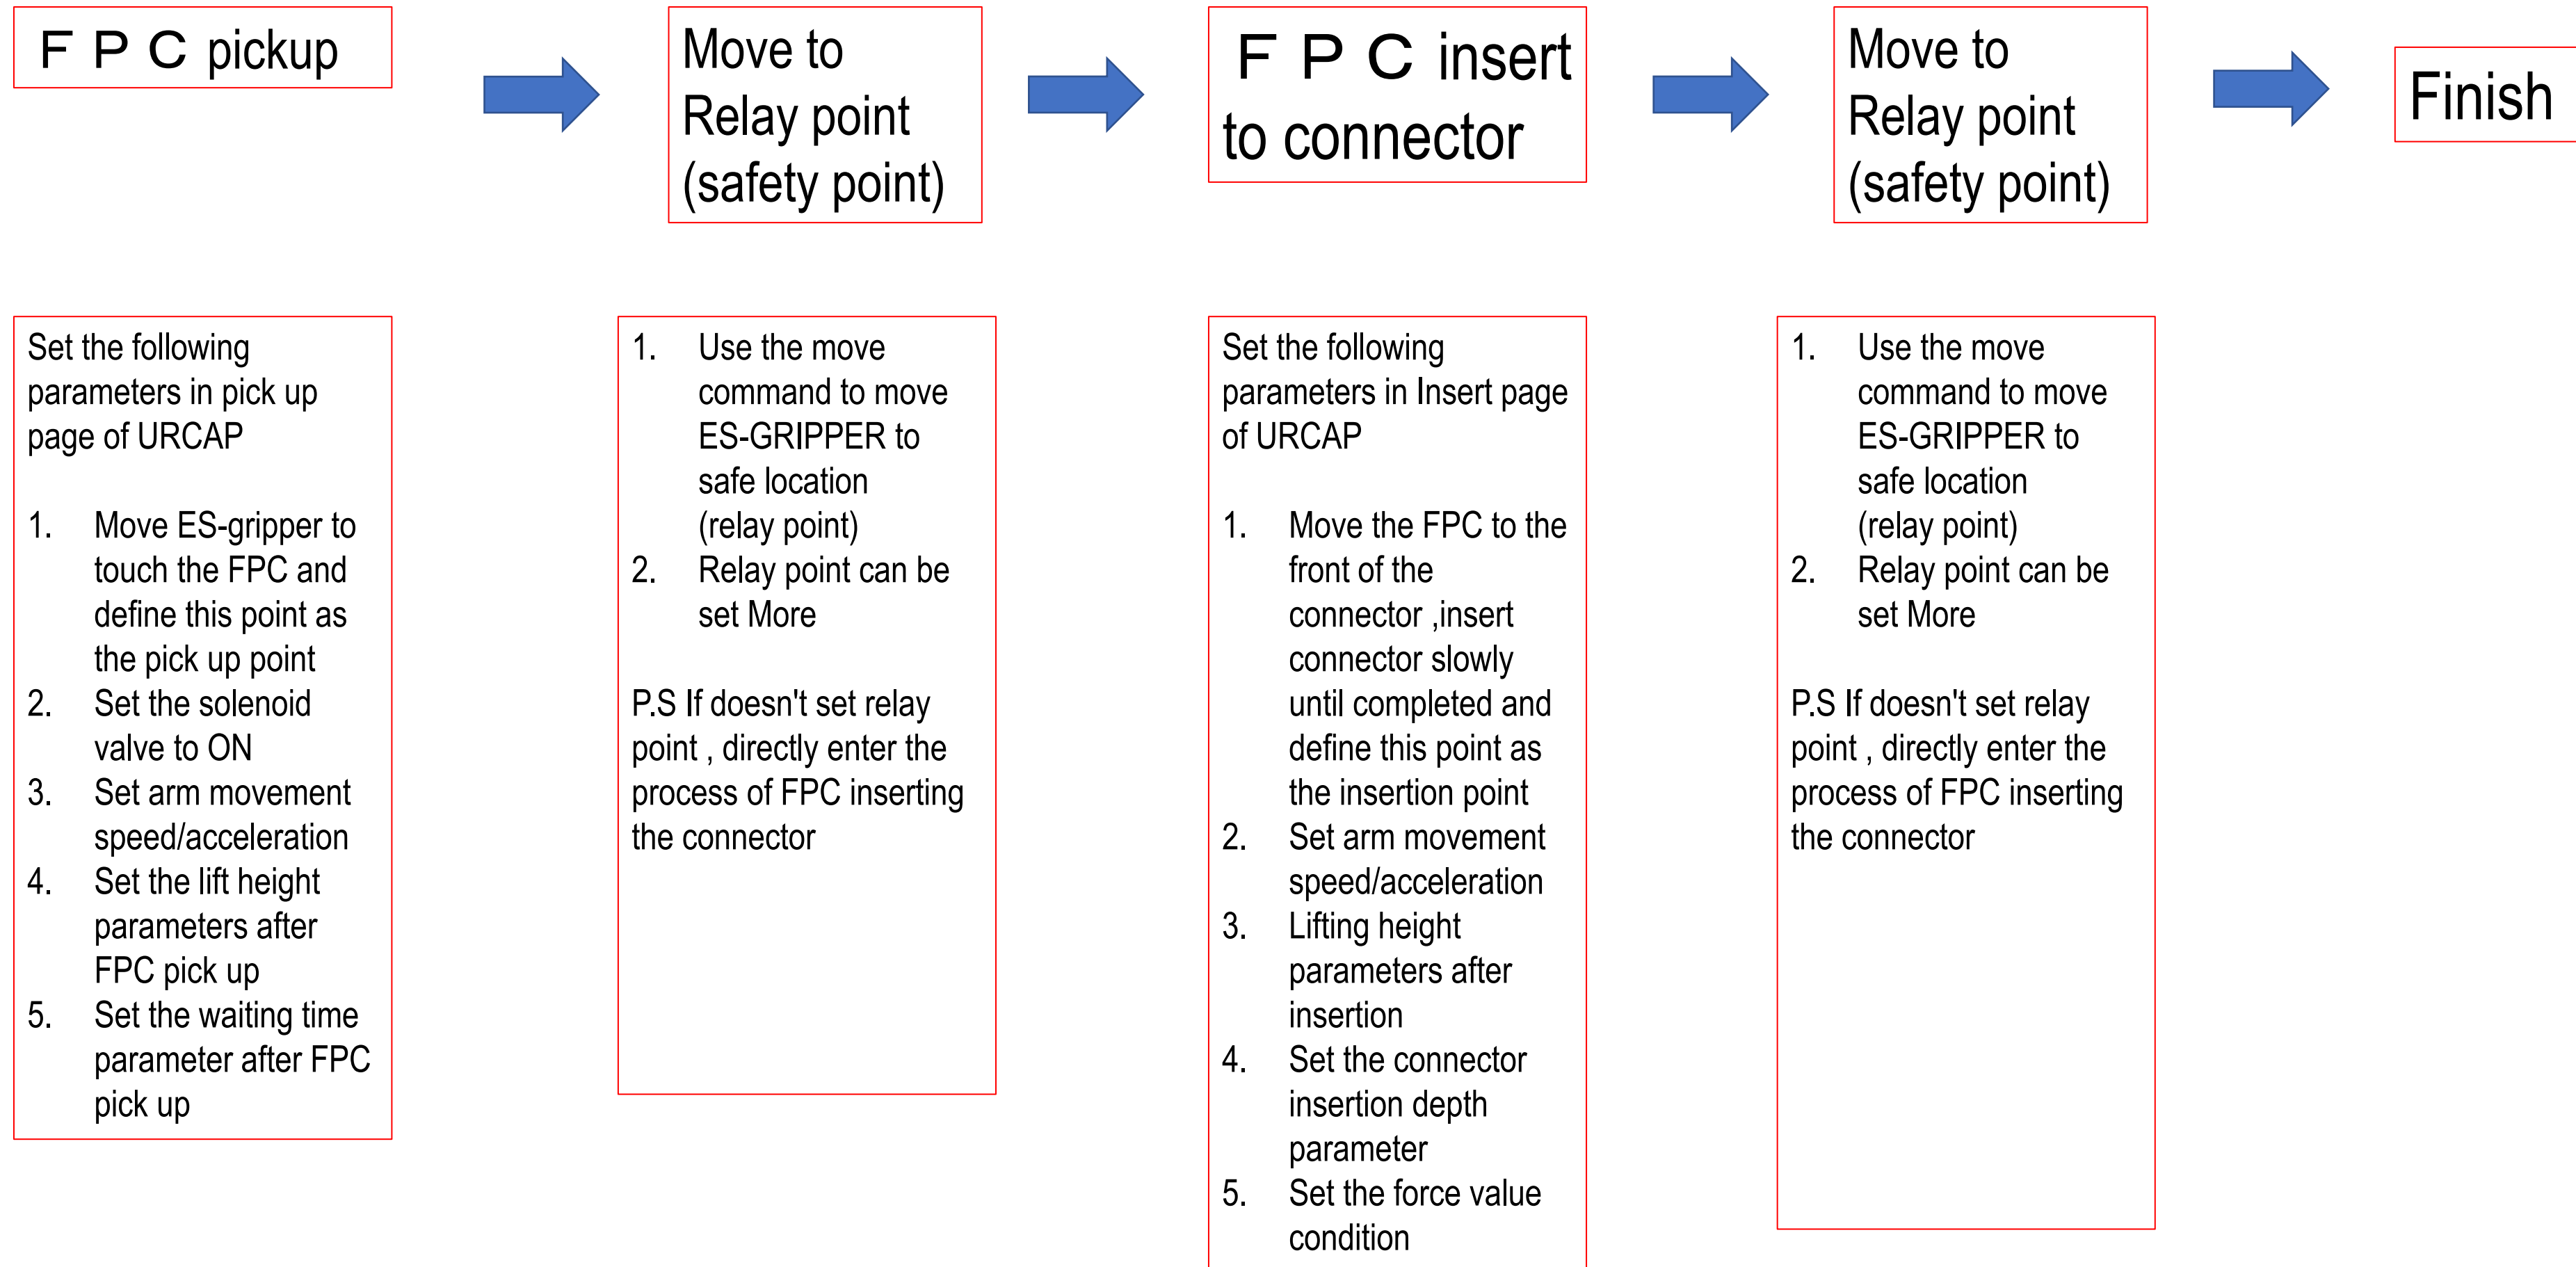

1. Connect the solenoid value to the robot control system .
2. Enter the corresponding ports of the digital outputs of the robot control system in the input field.

Control box output wiring

When using the robot control system, I-PEX recommends using the digital outputs of the "Digital I/O" group for general purposes to control the solenoid value . The output address to be configured refers to the numbering of the ports shown above.

Connector insertion process description

URCap setting for Vacuum generator control

The screenshot displays the URCap configuration interface for the 'Force Daemon Service'. The left sidebar shows a navigation menu with 'URCaps' expanded, highlighting 'Force Daemon Se...'. The main panel is titled 'G4 Technology' and contains the following settings:

- Digital out:** 0 (highlighted with a red dashed box and a yellow callout: "Press this button to complete the solenoid valve output setting (control the vacuum generator action)")
- Tool Center Point:** TCP
- Positioning:** X 0.0 mm, RX 0.0 deg, Y 0.0 mm, RY 0.0 deg, Z 0.0 mm, RZ 0.0 deg
- Buttons:** Start Daemon, Stop Daemon

Below the settings, a dashed line separates the configuration from the description: "G4 Technology" and "The Daemon is a loop that runs a python script".

On the right side, there is a photograph of the digital output wiring. The top part shows a terminal block with labels DO0 through DO7. The bottom part shows the physical wiring, with a red dashed box highlighting the connection for DO0 and a yellow callout: "Control box output wiring".

The bottom status bar includes a 'Normal' indicator, a 'Speed' slider at 100%, and a 'Simulation' toggle switch.

F P C pick up setting page

Step1: Click the button to set the pick up point

Step2 : move the ES-gripper to the FPC pickup position (Use the move function of the UR robot)

Step3 : press this button to complete the pick up point setting

step4 : in order to pick up FPC, please enter an appropriate value

Check point of pick up

Speed : 3.0 m/s → move speed

Accel : 150.0 m/s² → Acceleration

Start up offset: 50.0 mm → Lift height after FPC pick up

Wait Time: 0.3 sec → Wait time after FPC pick up

FPC pick up position

F P C insert into connector setting page

Step1:
Click the button to set the insert point

Step2: move the ES-gripper to the connector position (Use the move function of the UR robot)

Step3:
press this button to complete the insert point setting

Step4: Enter the suitable value

Parameter	Value	Unit	Description
Speed	1.0	m/s	Move speed
Accel	150.0	m/s ²	Acceleration
Before offset	30.0	mm	The distance before the FPC insert into the connector
Back offset1	5.0	mm	1st segment of the fpc insert into connector
Back offset2	5.0	mm	2nd segment of the fpc insert into connector
Insert up offset	50.0	mm	Lift height after FPC pick up
Wait Time	0.3	sec	Wait time after FPC insert completed
Force Type	Custom		
Force1	> 0.2	N.m	The force value of Fpc insert into the first segment of the connector/Judgment condition
Force2	< 0.15	N.m	The force value of Fpc insert into the first segment of the connector/Judgment condition
Force3	> 0.22	N.m	Force value of Fpc insert completed/Judgment condition

FPC insert connector parameter definition

When the fpc is insert into the connector, at the segment position (back offset 1 / Back Offset 2 / Insert Finish), the force value meets the judgment formula (Force1 value / Force 2 value / Force 3 value) and then enters the next program

FPC insert into Connector example

I-PEX insert

Set inserted pose

Move here

Speed : 1.0 m/s
Accel : 150.0 m/s²

Before offset : 5.0 mm
Back offset1 : 0.8 mm
Back offset2 : 0.2 mm

Insert up offset: 50.0 mm
Wait Time: 0.3 sec

Force Type: Custom
Force1: > 0.0 N.m
Force2: < 0.442 N.m
Force3: < 0.632 N.m

Connector insertion waveform
(define by connector)

グラフ 3. 30P 挿入力波形 /
Graph3. 30P Mating force waveform

Calculation of torque at insertion

①Before PLUG insertion : 0N \Rightarrow 0N \cdot m

②Peak : 8.5N \Rightarrow 0.442N \cdot m

③Mating completed(Mating force standard) : 12.15N \Rightarrow 0.632N \cdot m

※Because torque setting beyond insertion force is necessary.

Torque calculation of connector insertion force)

$$T = P \times \frac{L}{1000} \times \sin 45^\circ$$

Body

Attachment

T : Torque(N・m)
P : Mating force(N)
L : Distance(mm)

Connector insertion waveform
(define by connector)

グラフ 3. 30P 挿入力波形 /
Graph3. 30P Mating force waveform

Calculation of torque at insertion

① Before PLUG insertion : 0N ⇒ 0N ・ m

② Peak : 8.5N ⇒ 0.442N ・ m

③ Mating completed(Mating force standard) : 12.15N ⇒ 0.632N ・ m

※ Because torque setting beyond insertion force is necessary.

Notice

- Be sure to fix the cable and reserve the length of the cable at the arm joint to avoid breaking the cable when the robot is working.
